

How to correctly order a hose

1. Measure the overall length (OAL). To do that measure from end to end, or in the case of a 90° measure to the middle of the opening.
2. Identify what type of hose it is, what pressure it needs to withstand. Anything in particular we need to know, i.e. an orientation of a 90° fitting.
3. Any part numbers visible that you could include?
4. What type of thread are the fittings?
5. Anything else you want to include feel free, details can't hurt!
6. Sometimes sending us the hose/belt/etc. might be your best bet.
